

[Reconditioning Batteries Helps the Environment](#)

Want to make an extra few bucks each month and help clean up the environment too? Reconditioning batteries may be something you would like to do. Online businesses are growing at an incredible rate. These niche sectors are making more and more money every day. Finding cheap auction batteries, reconditioning them and selling them for profit can be done with the proper knowledge.

The use of cordless devices has exploded and created a disposal problem for millions of batteries. A simple technique exists that can be used to create a fresh new battery out of a defunct cell. Batteries, most especially rechargeable ones, are more easy to use than worrying about plug-in electrical devices. What can be done when no outlets are available? Sometimes batteries are the only option. But, using rechargeable batteries is not without its pitfalls.

Even with rechargeable batteries, their lifespan is a problematic issue. They do not last forever. After so many charges, the batteries no longer take a charge and can even burn out the charger. So what is the solution? And how can someone take this information and turn it into a recycling situation as well as a income opportunity?

First off, there are smart chargers. These wonderful devices do not suffer from the same burn out that other chargers do. As many batteries as you desire can be charged and this type of device will continue to perform. One reason many batteries gets burned out and subsequently damage the charger is because the charging operation continues even though the battery is finished charging. Smart chargers stop when the battery is charged.

Equipping yourself with the proper knowledge is important to do the job right as well as to ensure that the operations are done safely. The other prime factor to be successful, besides the knowledge factor is to have the proper equipment needed.

A computerized battery analyzer is needed for testing. A slow battery tester or slow tester is required. For quick twenty minute jolts a thirty amp quick charger is a necessity. Other equipment requirements are: a battery load tester, a battery hydrometer, and test cables. and, Personal protective equipment is needed for this kind of work so eye and face protection as well as protective clothing are absolutely needed. A well lit, ventilated area should be chosen for your work space.

Renewable energy is the wave of the future. Conservation is not only good for the environment but also in high demand for any company that uses energy on a continual basis. Almost every company uses energy to some extent, even if it is as simple as batteries in their cell phone. This is why is reconditioning batteries could be such a great side business.

Tapping into this pool of clients is a simple matter of advertising and targeted marketing. Contacting multiple companies about your service is a simple matter of seeing what they need and finding a way to get it to them cheaper and more efficiently. Companies run well when working at the most affordable level. Finding ways to save companies time and money can produce a demand for any type of service. Reconditioning batteries is a simple way of doing this if you have the right knowledge, training and equipment.
