

## [Renting Security Metal Detectors](#)

You don't have to hire a private detective to keep you safe. You can rent a metal detector and keep your area safe from unnecessary risk.

Everybody has seen and have been subjected to security metal detectors. They are everywhere: at the entrances of high security building, at the airport, etc. The added security of having metal detectors manages risk properly and should be utilized more. Metal detectors are also a good idea because it is pretty much hassle free for people that need to be subjected to this added security because they can be built into an entrance people just have to walk through it.

While the safety and security of a metal detector is unquestionable, what do you do when you need one for only a short period of time and don't want to make the unnecessary investment of purchasing one? In instances like these, what you do is to find a metal detector rental.

Perhaps you are about to have an important event and if the venue for your affair lacks the security of having a metal detector then you should find yourself a metal detector rental so you can lease one. Of course you can make do with hiring added personnel to ensure the safety and success of your event. However, nothing beats the security that a metal detector can bring so it is better to rent one from a metal detector rental.

Even if you instruct personnel to inspect bags and individuals that enter a venue, you won't be sure that unscrupulous individuals have not successfully concealed weapons from your personnel's probing eyes. Even if you have the best personnel on the job, you will need to aid their efforts with the help of a metal detector. When the influx of people become too much to handle manually, you can always count on the reliability of a metal detector. For this reason, you will need a metal detector rental service provider.

A metal detector rental service provider can offer you a whole range of metal detectors. You may want to rent one that comes with a scanner. This is usually a contraption with the metal detector fashioned into doorway and attached to it is a conveyor belt that will further subject bags to further security with security xrays. Whatever your metal detecting needs, a metal detector rental service provider can help you choose the right one to ensure security and safety to your event.

For ages, man has hammered against rock to obtain precious materials from the earth's surface. This can coal, ore, diamonds and other minerals but during that time, metal detectors were both crude and primitive. It is only by hitting the ground and listening to the sound that will determine if there was something underneath.

It wasn't until the 1930's that engineers were able to develop a system that works based on the radio frequency. This was better than using the hammer in the past but the device was quite heavy with a heavy battery pack carried on the person's back.

Further improvement with this machine happened during the second world war. Soldiers used this to clear an area of landmines so that troops can move forward. The metal detector became useful again when incidents of hijacking occurred in the 1970's, which prompted airports and other vital installations to come up with a way to deter such a threat.

Today, the security metal detector comes in all shapes and sizes. Security personnel can use a stationary machine where the person has to walk through to check for knives, bombs and concealed weapons. In places that this is not applicable, the hand held version can be used.

Users of the security metal detectors can increase the sensitivity of the machine. This means the alarm will even sound if the individual has a set of keys, a mobile phone or some coins in the pocket. The person will just have to bring it out to show the one manning the gate before going any further.

But the metal detector is not only used for security. Hobbyists and archeologists also use this to either find buried treasure or artifacts. There are also different models available and the high tech versions can determine the size, weight and description of the object even before this has been excavated.

The difference perhaps with those used by security and hobbyists is that those assigned at a certain posts don't need to use headphones. When something is detected, the people there will immediately go request the person to empty the pockets and walk through the machine again to make sure there are no problems.

Should the alarm still sound, there could still be something on the person or there is a problem with the machine. Metal detectors have evolved from simply searching for minerals to applications for military and civilian use and this will continue until a better machine comes along to replace the old system.
