

## [Run Your Car on Hydrogen - Fraud Or Oil Industry Cover-Up?](#)

Back in the 90's, I did not think there would ever be a day that I would have to consider whether or not I wanted to eat breakfast or whether I wanted to pay for gas. Back then, the cost of gas was only about 1/3rd the cost of coffee, and putting it in your car barely put even a small dent in your budget. Today, that is no longer the case, as oil companies have held their grip around the government's neck and prevent any research to be done in how to bring these high gas prices back down.

The government is trying to stay out of it, assuming that the only solution is to let the market right itself. Unfortunately, for the market to right itself the oil industry couldn't be purposely taking advantage of the oil shortage in order to make more money. If the high gas prices were due to the economy alone, gas would probably be much cheaper right now. And since citizens of the United States will never pay a tax hike large enough to help cover the cost of gasoline, the only real option is to run your car on water using newly created hydrogen technology.

The only way to reduce the cost of oil is if we need less of it to run our transportation. One of the only things to do to stave off global demand is to come up with an alternative fuel source that will be effective at relieving some of the stress at the gas tank. We have all heard of the possibility of using hydrogen gas, but hydrogen gasoline has simply become too expensive to produce, and many companies have stopped researching it altogether.

But there is, in fact, a way to power a car on hydrogen that already exists. It is known as HHO gas, and it has the potential to save you thousands of dollars each year by improving gas mileage two to three hundred percent. All you need to do is convert your standard car into a hydrogen based hybrid car using a simple machine.

Since this is not pure hydrogen - rather it is a hydrogen particle taken from water - there is no danger to adding this to your engine. You are improving your gas mileage, but you are doing so without risking the safety of you or your car. All you have is a makeshift hybrid car that gets significantly better gas mileage.

What it comes down to is that this involves harnessing one of the most plentiful resources on the planet. I'm speaking of water, of course! Water has two molecules of hydrogen and one of oxygen. When a small electrical current is fused into this molecule, it becomes broken down into its separate parts. This simple conversion apparatus takes the hydrogen and oxygen molecules and converts them both to HHO gas, or Brown's gas.

When this gas (Brown's gas) is introduced into your car / truck's combustion system using the method shown in the tested conversion manual, it acts as a very strong and highly efficient burning fuel additive. This makes it possible for you to run your own car on hydrogen and water. Not to mention, this will subsequently cause your vehicle to run much cleaner, since it will burn a lot less gas, which deposits much less dangerous carbon into the Earth's atmosphere.

Hydrogen technology is someday going to completely run cars. It is a renewable resource that can be found covering 66% of the earth. But until the day that hydrogen technology is used instead of gasoline, you can still save a great deal of money at the pump as well as harm the environment less if you start using an HHO gas supplement now.

### About the Author

Quit paying out the Wazoo for fuel! Easily increase your fuel mileage and realize over \$100 per month with the proven [Run Your Car on Hydrogen](#) system. It's fast, cheap, and has a risk-free guarantee! Use [Water for Fuel](#) now.
