

## [Free windows repair](#)

Faults develop in a Windows PC for several reasons. Mostly, your Windows operating system develops faults with errors in the registry system. When this happens, your computer starts to get slow, your monitor screen freezes, and your PC fails to boot. Your PC also develops faults if it is infected by virus or spyware. There could be many other reasons, but most of the solutions could be found in free windows repair software downloads available on the Internet.

The registry system in your Windows PC develops errors as you go on using your computer. With build-up of errors the registry grows larger in size. During the time you install and un-install software programs, traces of irrelevant file definitions are left behind in the registry. Windows operating system searches for relevant data in the registry when it is executing a task or a program. If the registry size is too big, Windows takes more time to scan the registry to locate the required data. This slows down your computer. More-over, errors in the registry give rise to conflict, and this may stop your PC from working altogether. You need to repair the registry atleast twice a month to keep your computer operating normally. Free Windows repair registry cleaning software is available on the Internet.

The registry in your computer is a database in which important data is stored for Windows operating system to function properly. Unfortunately, during the operation of your PC, obsolete, invalid and corrupt entries accumulate in the registry system which may cause various kinds of problems. Your computer may start to get slow and eventually hang, or you may have a blue screen coming up on the monitor every now and then. You may find that your computer is not booting at all. In order to avoid this, you need to clean and optimize your registry at least twice a month. If you search for free windows repair on the Internet, your search results would provide you with several registry cleaning options.

Scan your PC regularly for viruses and malicious software. You may get infected while you are browsing the Internet, or a virus could infect your computer as soon as you open an unknown email attachment. While you are on the Internet, your computer remains vulnerable to viruses and spyware. Your computer could get slow, or totally stop functioning. You should scan your PC regularly for these vulnerabilities, and have proper anti-virus and anti-spyware software installed in your computer for detection and removal of the infections. Free windows repair offers online spyware and virus scanning features which you may use to find out if your computer has been infected.

Data fragmentation in your hard drive renders your computer to run slow. The data in your hard disk gets fragmented as you use your computer, and the fragmented data is scattered all over the hard disk. Windows looks for relevant data when it is executing a program. If the data is too widely scattered, it takes more time for Windows to scan the hard drive in order to retrieve the relevant data. This makes your computer run slow. Defragmenting your hard disk keeps your data contiguous, and this helps your Windows operating system take less time to locate the data that it requires. You should regularly use free Windows repair defrag software that comes along with your Windows. This will keep your hard disk in shape and your PC performing optimally.

Important files in your PC may get deleted by error. As long as the files have been deleted from your re-cycle bin, there is every chance that they could be recovered. Deletion of important files may result in PC errors. You may use free Windows repair recovery software to recover the files that you have deleted by mistake. The software can also help you recover lost files.

There are several free windows repair on the Internet which could be downloaded and installed in your PC. Free file recovery software can be used for your file recoveries, retrieving your deleted files, and also in helping you to recover a lost file. Some of the free recovery software has the feature to recover part of the file that has been damaged beyond recovery.
